

Mathematical Truth & Beauty in Physics

Friedrich Hirzebruch Lecture
13 October, 2015

18th Century

- Mozart's *Die Entführung aus dem Serail* or "The Abduction from the Seraglio" K. 384 (1782)
- M's counting total number of bars of each act and performing various calculations. Leads to arithmetic series: 2, 3, 5, 6, 28

Handwritten musical score on aged paper with multiple staves and numerical annotations.

Left Margin Calculations:

- $\frac{108}{60} = 1.8$
- $\frac{72}{40} = 1.8$
- $\frac{112}{60} = 1.866...$
- $\frac{36}{20} = 1.8$
- $\frac{23.5 \cdot 6}{20} = 7.05$
- $\frac{44}{1} = 44$
- $\frac{43}{1} = 43$
- $\frac{39}{28} = 1.392857...$
- $\frac{34}{1} = 34$

Right Margin Calculations:

- $\frac{276}{24} = 11.5$
- $\frac{440}{20} = 22$
- $\frac{44}{1} = 44$
- $\frac{176}{1} = 176$
- $\frac{264}{1} = 264$
- $\frac{484}{1} = 484$
- $\frac{264}{1} = 264$
- $\frac{220}{1} = 220$
- $\frac{176}{1} = 176$
- $\frac{44}{1} = 44$
- $\frac{44}{1} = 44$
- $\frac{176}{1} = 176$

Staff Annotations:

- Staff 1: $\frac{108}{60}$
- Staff 2: $\frac{72}{40}$
- Staff 3: $\frac{112}{60}$
- Staff 4: $\frac{36}{20}$
- Staff 5: $\frac{23.5 \cdot 6}{20}$
- Staff 6: $\frac{44}{1}$
- Staff 7: $\frac{43}{1}$
- Staff 8: $\frac{39}{28}$
- Staff 9: $\frac{34}{1}$

Bottom Section:

3	10	235	2.3.5	10	44
8	14	350	2.3.5	14	176
11	39	504	2.3.28	39	264
34	84	1936	2.3.28	34	484

Courtesy of Robert D. Levin, musician and Mozart expert, Harvard University

This image shows a page of handwritten musical notation, identified as a sketch for Beethoven's Op. 106. The manuscript is written on aged, yellowed paper and consists of approximately ten staves. The notation is dense and complex, featuring a variety of note values, rests, and dynamic markings. There are several instances of heavy blacked-out sections, particularly on the fifth and sixth staves, indicating areas of revision or deletion. The handwriting is in dark ink, and the overall appearance is that of a working draft or sketch. The paper shows signs of wear, including some staining and discoloration, especially towards the bottom edge.

Beethoven sketch Op. 106, Stefan Zweig collection, courtesy of Michael Ladenburger,

Beethoven Haus Bonn

19th Century

- "Beauty is truth, truth beauty, -that is all ye know on earth, and all ye need to know."
- Ode to a Grecian Urn: John Keats

20th Century

(Dirac, Seminar IAS, Princeton 1961)

- Oppenheimer: “Professor Dirac. At what point did you realize that your relativistic equation for the electron was correct?”
- Dirac: “I was working at home and had to go to the university library to check the spectrum of hydrogen.
- “But as I was getting my bicycle out of the garage, I realized that this equation was so beautiful, it had to be right!”

21st Century

“I hope that you will agree that the only answer to the Question: *Does the world embody beautiful ideas?* ... is a resounding Yes!”

Frank Wilczek, “A Beautiful Question: Finding Nature’s Deep Design,” p321

Optimist

Truth = Beauty!

But the perception of either requires
enormous skill!

And enormous time!

= Hard Work

Skeptic

Truth and Beauty generally go together:
But not always!

Mathematical Beauty

Lecture by Fritz Hirzebruch

Occam's razor

Elegance of presentation

Perspective

Unifying different ideas

Subjective beauty is difficult to make universal

Scientific Beauty

Occam's razor: simplicity

Elegance, symmetry, unity

Subjective beauty is difficult to make universal

Mathematical Truth

- It is *proof* that is our device for establishing the absolute and irrevocable truth of statements in our subject. This is the reason that we can depend on mathematics that was done by Euclid 2300 years ago as readily as we believe in the mathematics that is done today. No other discipline can make such an assertion. **Steven Krantz 2007**

Physical Truth

Truth in Physics: Experiment

Objective: Qualitative and Quantitative

Qualitative: Simple, Elegant Laws

Equations of motion

Symmetries of nature

Observed particles, charges,...

Quantitative: Spectral Frequencies

Constants of Nature

Magnetic Moments

Particle Masses

Cross sections

Example: Fermat's Last Theorem

- Theorized in 1637

$$x^n + y^n = z^n$$

no integer solutions if $n > 2$

- Experimental Verification 1994, Taylor and Wiles

Riemann Hypothesis posed 1859

$$\zeta(z) = \sum_{n=1}^{\infty} \frac{1}{n^z}$$

Zeros on negative real axis and
real $z = \frac{1}{2}$ (the critical line)

“Theoretical” Evidence

The 10^{22} -nd zero of the Riemann zeta function

A. M. Odlyzko

ABSTRACT. Recent and ongoing computations of zeros of the Riemann zeta function are described. They include the computation of 10 billion zeros near zero number 10^{22} . These computations verify the Riemann Hypothesis for those zeros, and provide evidence for additional conjectures that relate these zeros to eigenvalues of random matrices.

Still no experimental verification! (proof)

Physics: Traditional Understanding

- Newton: planetary motion 17-18th century
- Maxwell: electricity and magnetism 19th
- Boltzmann, Gibbs: statistical physics 19th
- Einstein: relativity, gravitation, Brownian motion, ... 20th
- Bohr, Schrödinger, Heisenberg, Dirac: 20th
particle based quantum theory
- ALL PARTS OF MATHEMATICS

Summary Lesson

- In physics one tries to isolate a part of the whole and describe it by mathematics.

Consider:

The TWO cornerstones
of 20th century physics.

Quantum Theory

$$i\hbar \frac{d\psi}{dt} = H\psi$$

1926

Relativity

$$E = mc^2$$

1905

Relativity Predicts that Particles can Decay and New Ones Created

- Non-relativistic quantum theory inadequate.
- Proposal: Describe particles by a field of waves

Forces arise from the field

All observable phenomena predicted by field

Field and Waves

- Field $\varphi = \varphi(x)$
- Field satisfies a wave equation. **Example:**

$$(\square + m^2)\varphi(x) + \varphi^3(x) = 0$$

- Matter field: a field of waves
- Equations given names:
Klein-Gordon, Maxwell, Dirac, Weyl, Yang-Mills,
Quantum Electrodynamics,
Quantum Chromodynamics, Standard Model,

Field and Particles

- Particles are “Quanta” of the Field φ
- Ground State (empty) Ω
- One Particle State $\varphi \Omega$
- Three Particle State: disentangle $\varphi \varphi \varphi \Omega$

WAVES & PARTICLES

- Waves and particles together in one. This is a way to resolve the “duality” of waves and particles.

Ultimate Quantitative Test

Magnetic moment μ of an electron. Most accurate measurement ever made.

1913

1928

$$\mu = \kappa \frac{e\hbar}{mc} , \quad \kappa_{\text{Bohr}} = \frac{1}{2} , \quad \kappa_{\text{Dirac}} = 1 .$$

$$\kappa = 1,001 \text{ Kusch (1947)}$$

$$\kappa = 1,001\,159\,652\,180\,73(\pm 28)$$

Deviation from 1 is effect of fields: interaction between the Dirac field of electron and the Maxwell field of electromagnetism.

Represents triumph of fields as basic paradigm; particles are consequences of fields.

Measure: Parts in 10^{12}

Gabrielse (2006, 2008)

$$(\kappa - 1.001\,159\,652\,000) * 10^{12} = 180.73 \pm .28$$

A.I.P. “Physics Achievement of the Year: 2006”

Experiments refined for 65+ Years

Calculation refined for 65+ Years

Most accurate measurement ever performed.

Complete agreement between experiment and rules for
calculation!

Something must be “right”!!

23 Nobel Prize winners connected with this spectacular
achievement.

YET: Are THE two cornerstones
of 20th century physics
mathematically compatible?

This *is a* central “big” question!

Short answer: We only know a partial yes!!

Slightly Longer Answer

Exact “non-perturbative” theory:

Constructive Quantum Field Theory

$d=2$ ✓ life on a line + time

$d=3$ ✓ flatland + time

$d=4$? our space-time

$d=5$ ✗

$d=10,11$?????? world of strings

Historical Departure

Classical mechanics, classical gravitation, classical Maxwell theory, fluid mechanics, non-relativistic quantum theory, statistical mechanics,..., **each** has a logical foundation. Each is a branch of *mathematics*.

But: perturbative renormalization analysis leads physicists to believe that rules for quantum electrodynamics are logically **inconsistent**.

The most accurately known electrodynamics' effect may have no logical explanation using only electrodynamics!

Must Study Yang-Mills

- Yang-Mills theory “asymptotically free”
 - Goes beyond dimension counting (Sobolev)
- This avoids difficulty as does QCD (YM version of electrodynamics)
- However “standard model” has “Higgs field”

A. Weil on Riemann Hypothesis

- 1. When I was young I wanted to prove the RH.
- 2. As I got older I wanted to see the proof.
- 3. Now I would only like to know that it has been proved!

Closed Form of Solution

Solve algebraically

– Appears intractable

First Approach

1. Canonical Approach on Hilbert Space

– Follow Heisenberg:

$$[q, p] = i\hbar$$

$$[q(x), p(x')] = i\hbar\delta(x - x')$$

– Hamiltonian

$$H = H(q, p) = H^* \geq 0$$

Second Approach

2. Path Integral Approach: Classical

$$\langle A \rangle = \int A(\Phi) d\mu(\Phi) \quad A \in \mathcal{E}$$

$$\langle A \rangle \text{ " = " } \frac{1}{Z} \int A(\Phi) e^{-\mathcal{A}} d\mu_C(\Phi)$$

Both Approaches

- Analysis in infinite dimensions
 - (each Fourier mode)
- Symmetry Key
- Localization (Divide and Conquer)
 - Renormalization Group Ideas
 - Localization (exponential decay)

Unify the Two Approaches

Reflection Positivity:

Konrad Osterwalder and Robert Schrader

Reflection:

$$\vartheta(A) = \left[\text{Right Arrow} \right] \left[\text{Left Arrow} \right] = A$$

Osterwalder-Schrader Quantization

$$\underbrace{\langle \vartheta(A)B \rangle}_{\text{classical}} = \underbrace{\langle A, B \rangle_{\mathcal{H}}}_{\text{quantum}}$$

$B(t)$ translate by $t > 0$

$$\underbrace{\langle \vartheta(A)B(t) \rangle_{\varepsilon}}_{\text{classical}} = \underbrace{\langle A, e^{-tH} B \rangle_{\mathcal{H}}}_{\text{quantum}}$$

Pictorial Interpretation in context of planar algebras

$$\mathcal{V}(A) = \text{Diagram} = A$$

The diagram consists of a central rectangular box labeled $e^{-\beta H}$. Above this box are two smaller rectangular boxes, the left one labeled \mathcal{R} and the right one labeled R . Each of these boxes is connected to the central box by a vertical line with three dots above and below it. From the top of each of these boxes, a line extends upwards and then loops back down to the top of the central box, forming a large loop on each side. A vertical dashed red line passes through the center of the diagram, separating the \mathcal{R} and R boxes.

Multiplication and Reflection

- Multiplication: bottom to top
- Horizontal Reflection:
 - Reflection in time
- Vertical Reflection:
 - Hilbert Space Adjoint
- Assume Invariance of Picture Under Isotopy

180° Rotn. × Reflection = *

$$\langle A^* A \rangle \geq 0$$

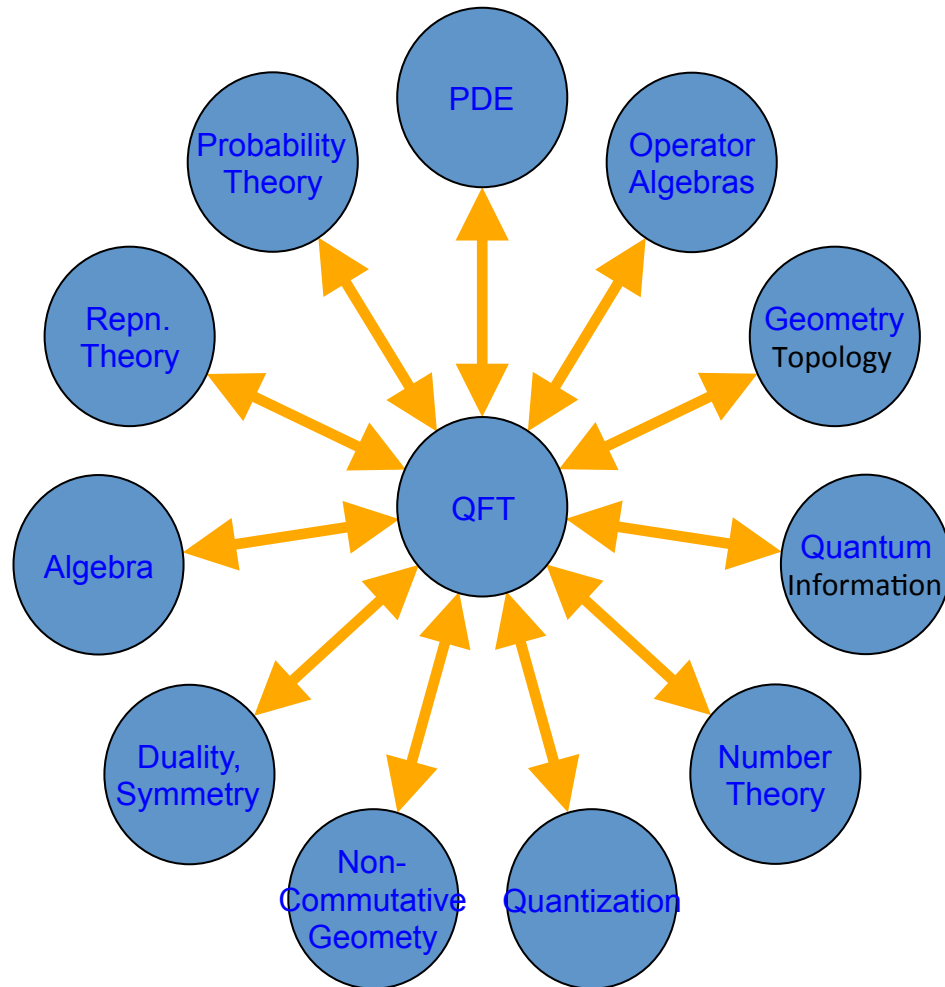

RP Permeates Physics, Mathematics

- Quantum Field Theory
- Condensed Matter Physics of Phase Transitions
- Topological Field Theory
- Quantum Information Theory
- String theory (?)
- Oscillating functionals+
